HOTELS

For the past forty years, Culligan Italiana has been designing state-of-the-art swimming-pools with outstanding technical and aesthetic qualities. Whether private or public, for hotels or clubs, thermal or competition, pools have different specifications according to the needs and wishes of customers. But they all have one thing in common: the highest quality water.

Because it is water that makes the difference

Culligan[®]

A swimming-pool in your garden will not only enhance your home, it will also radically transform your lifestyle. A swimming-pool will take you outdoors and into nature, allowing you to enjoy a relaxed holiday atmosphere

at weekends and during the evenings in warm weather. In the summer months, the poolside will become your dining room and sitting room. What could be better than lying in the sun, your feet in the water? A pool will make

private pools

Culligan swimming-pools: design and prestige

your summer an entirely different experience! Furthermore, a swimming-pool will transform your garden into a sort of private amusement park, so that your children can spend their leisure time in a safe and healthy way!

Simple and elegant, for serious exercise or lazing around, for you or for your children, every pool is different and, like a house, it reflects its owners' personalities and lifestyle.

good taste & relaxation

Tailored to your wishes, your needs and your pocket. Attractive, traditional, aristocratic, reinforced-concrete pools, or modern, quick, functional prefabricated panel pools? Whatever your chosen construction technique, Culligan water will make it really wonderful.

Indoors, just like outdoors, water is the most appealing, natural and timeless of all decorative elements.

wellness

Culligan swimming-pools: health and beauty

One of the fastest-growing market segments is that of pleasure-seekers, people in search of products and activities for their leisure time that will bring them a sense of pleasure and physical or psychological well-

being, enriching their lives with small but significant pleasures.

These customers are demanding and sophisticated, and are generally very well informed about the very best the market has to offer in every sector.

Beauty-farms, the modern-day temples of beauty and pleasure, are becoming increasingly popular as formulas for holidays and leisure focused exclusively on self-gratification.

Hydromassage, whirlpool, colour therapy and music therapy all contribute to creating the state of well-being sought by beauty-farm clients.

fit
Culligan

As the ancient Romans were well aware, thermal baths are not only places for pleasure and relaxation but above all serve for physical therapy and rehabilitation. Thermal rehabilitation with a gentle, natural and above all non-invasive approach has enjoyed an enormous revival in recent years and is attracting growing numbers of followers in all modern societies.

Water gymnastics, hydro pool circuits, hydrobike and water running are all modern rehabilitation techniques that complement the well-known therapeutic qualities of thermal waters.

Designing and building a public swimming-pool is a complex undertaking that requires knowledge and experience in a wide range of fields, including construction and roofing technologies, water treatment,

chemical conditioning and thermal engineering, not to mention a perfect knowledge of applicable national and regional laws and regulations. For the past forty years, Culligan Italiana has been designing and

constructing beautiful, state-of-the-art swimming-pools that are built to last. Our filtration systems are based on the experience acquired in installing thousands of similar systems worldwide.

Competition and sports pools are a specialist field requiring cooperation between architects, engineers, heating and plumbing engineers and water and air treatment specialists. Functional and attractive architecture must be combined with extremely high levels of hygiene and safety as well as reliable, simple and cost-effective technology.

holidays & tourism

Culligan swimming-pools: beaches, resorts and hotels

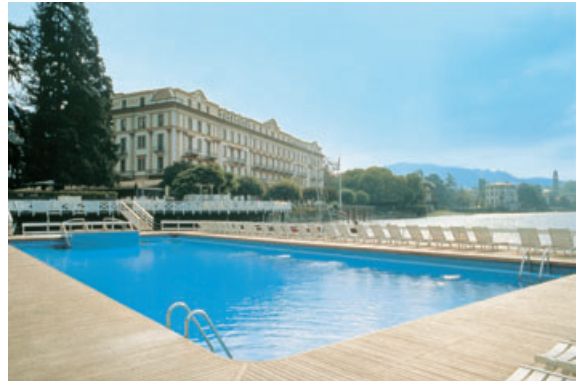

Swimming-pools are now seen as essential facilities by managers of beaches and seaside hotels. They allow guests to bathe even when the sea is rough, dirty or polluted, and make the perfect venue for games, dinners, parties and sports activities.

In tourist resorts, residences and holiday clubs, the swimming-pool naturally becomes the hub of the small community's social life.

It is a meeting point, a place for socialising and spending the most important and enjoyable part of the holidays.

A quality pool encourages guests to spend their time at the hotel or beach rather than seeking entertainment elsewhere, and this has obvious benefits for the management.

swim filtration system with selective filtering beds

Swim Filters are based on “Filtr-Cleer” process, featuring high velocity selective filtration. They employ a variety of minerals having different bulk densities and granule sizes so as to form a selective filtering bed.

The minerals are arranged with the largest and lightest granules at the top, followed by the layers of diminishing particle size but increasingly heavier minerals.

This special and exclusive arrangement, resulting from research and tests in the field over a long time, makes it possible to achieve a filtration velocity which is five times the velocity of conventional sand filters as well as an exceptional quality of filtrate.

Typical placing of selective filtering bed in a multi-layer filter.

hydro-clear filtration system by diatomaceous earth

Self-cleansing filtering elements. Filtration system by diatomaceous earth coat.

Hydro-Clear Filters are based on the most sophisticated process for making swimming-pool water crystal clear: filtration by diatomaceous earth. The microporosity of this very fine white powder, produced from the silica-based shells of a peculiar type of microalgae, makes it possible to attain a very high degree of water clearness to the extent of 1-micron range. The technical feature which characterizes these systems is the self-cleansing Culligan filtering element. The dirty swimming-pool water is pumped through the filter and passes through the diatomaceous earth coat uniformly spread on the filtering elements. The turbidity particles are trapped in the coat and sparkling clear water is directed to the pool.

QUALITY SYSTEM CERTIFIED ACCORDING TO UNI EN ISO 9001:2000 NORM
